## 1 Introduction

The goal of this lab was to compute the coefficients of a Fourier series and verify these calculations with Python.

## 2 Equations

$$x(t) = \frac{1}{2}a_0 + \sum_{k=1}^{\infty} a_k \cos(k\omega_0 t) + b_k \sin(k\omega_0 t)$$

$$\omega_0 = \frac{2\pi}{T}$$

$$a_k = \frac{2}{T} * 2 \int_0^{T/2} \cos(k\omega_0 t) dt = 0$$

$$b_k = \frac{2}{T} * 2 \int_0^{T/2} \sin(k\omega_0 t) dt = \frac{4}{k\pi} \sin^2\left(\frac{k\pi}{2}\right)$$

$$x(t) = \sum_{k=1}^{\infty} \frac{4}{k\pi} \sin^2\left(\frac{k\pi}{2}\right) \sin(k\omega_0 t) = \frac{4}{\pi} \sum_{k=1}^{\infty} \frac{1}{k} \sin^2\left(\frac{k\pi}{2}\right) \sin(k\omega_0 t)$$

## 3 Methodology

The Fourier series for this lab was calculated using the following square wave function.

In the prelab, we calculated the expressions for  $a_k$  and  $b_k$ ; we found that the  $a_k$  term reduces to 0 because the function is entirely odd, with no even terms. There was also no offset, so the  $a_0$  term also reduced to 0. Hence, the final Fourier series was just the sum of the  $b_k$  terms.

The  $b_k$  term was then inserted into Spyder and the values for  $b_1$ ,  $b_2$ ,  $b_3$  were found. Calculations for  $a_0$  and  $a_1$  were not necessary since we know them to be 0. We then plotted the Fourier series approximation for the square wave using values of  $N = \{1, 3, 15, 50, 150, 1500\}$ , using  $T = 8$  s and a domain of  $0 \leq t \leq 20$  s.

## 4 Results

```
1 b(1): 1.2732395447351628
2 b(2): 9.547767314442451e-33 # This approximates to 0.
3 b(3): 0.4244131815783876
```

Implementing a user-defined function for  $b_k$ , we printed the values of the first 3 terms. Again,  $a_k$  is known to be 0 for all terms, so no terms were printed.

The plots above represent the square wave Fourier series for  $N = \{1, 3, 15, 50, 150, 1500\}$ . The series was implemented using the following function:

```

1 def x(t, N):
2     y = 0
3     for k in range(1, N + 1):
4         y += b(k) * np.sin(k * 2 * np.pi * t / T)
5     return y

```

The function returns the sum of terms of  $x_k(t)$  all the way up to  $N$ .

## 5 Error Analysis

No particular errors or matters of concern were brought up during the lab.

## 6 Questions

1.  $x(t)$  is an odd function. Examining  $x(t)$ , we can see that it consists of the  $b_k$  term,  $\frac{4}{k\pi} \sin^2(\frac{k\pi}{2})$ , and the sine term  $\sin(k\omega_0 t)$ . The first term is a squared function, and is even;  $x(-t) = x(t)$ . The sine function is odd;  $x(-t) = -x(t)$ . An odd function multiplied by an even function will be odd; hence,  $x(t)$  is odd.
2. As was demonstrated in the prelab,  $a_k$  will be 0 for all values of  $k$ , since the function is not even, so there is no relevant  $a_k \cos(k\omega_0 t)$  term.
3. The square wave Fourier series approximation grows closer and closer to being shaped like an actual square wave as  $N$  increases. One limitation of the approximation can be seen at the edges of the rectangular waveform; before entering and exiting the approximated top edge of the waveform, a sudden jump must be made.
4. As  $N$  increases, the additional coefficient terms being added are increasing in frequency while decreasing in magnitude, which translates graphically to a flatter waveform.
5. The clarity of the tasks, expectations, and lab deliverables was exceptionally clear for this lab.

## 7 Conclusion

In this lab, although no new tools in particular was explored in Python, we learned to use Python to assist in the calculation of the coefficients in a Fourier series and plot the ensuing approximations. Although the Fourier series does have limitations, it is very close in its ability to replicate just about any periodic waveform.
